- Focused

Professional Skills:

- C
- Java
- Android
- React.js
- Node
- GIT
- C++
- Python
- HTML5 CSS3 Javascript
- JQuery
- Arduino

PROJECTS

e-Certify |

Blockchain | Node | React.js

It is a blockchain based project for online certificate validation.

The major problem of counterfeit certificates can be tackled with the help of E-Certify, as it provides a solution to preserve the genuineness of a certificate.

It works on the idea that: "Only the issuer can upload the certificate and the rest people can only view it." The entire process works on the blockchain in partnership with the IPFS (to provide data security).

This Project was made at SIH 2019

Freehand.ml |

Machine Learning | Python | Flask

It is a machine learning based project for generation of front-end code of a web app only by using hand drawn images or sketches.

It works on the concept of Transfer Learning and includes a smart algorithm to generate and render the UI.

It serves as a great platform for absolute beginners to generate the front-end code for their very own website.

SmartBin |

Raspberry Pi | Arduino | Android

It is a hardware-based project running with an Ultrasonic Sensor to measure the distance and with Raspberry Pi 3B at its heart.

This project aims at creating a smart dustbin connected to a Wi-Fi network so that a user can monitor its %empty or %filled and be notified when the bin gets full! The bin must be accompanied with an App in order to access its live status!
